

GLOBAL TEAL MEET-UP

2021

#GTM2021

COMMUNITY CONVERSATIONS (FORMERLY OPEN SPACE)

EUROPE

December 09, 2021
14:00 – 16:00 CET

Jens Rinnelt

Wholeness, Evolutionary Purpose

“Collective presencing (Higher WE space) ”

In this session we practice collective presencing from the whole. In the last years many of us have been experimenting and practicing with new ways of working and self-organization, in other words becoming and being TEAL. Through this we have individually shaped and co-created the ecosystem we are part of. When we step back from our daily engagements, responsibilities and personal aspirations, what do we sense is the next collective evolution of the ecosystem itself? What do we perceive when we listen to the ecosystem of TEAL initiatives and co-creators? What is the wisdom of our intuition / Higher Self / the Collective Voice? And how can we then serve the whole in our daily engagements?

“Mindful reflective space ”

Reflection is key to learning and development, individually and collectively. In groups, teams and organizations, reflective spaces - when created and held appropriately - can also have great effects on the connection between people and with purpose, on appreciation and trust, on inspiration and creativity.

Mindful exchange is an amazingly enriching mode for reflective spaces as it deepens and expands the space and the experience within while relaxing it.

In this session we explore that mode while "using" it to reflect on what makes reflective spaces in organizations good and useful.

“Whole Mind Leadership”

If we want to create whole organizations, we need to be whole within ourselves: as within, so without. In this session, you'll play with two often underutilized Whole Mind Modes -- Sensing and Feeling -- which expands sense-making skills and improves decision-making.

Self-Organisation, Wholeness

“Many Minds Thinking”

We, individuals and our organisations, need to shift from a single-mind centralised individualistic mindset to a multi-mind decentralised symbiotic one, if we are to not just survive but thrive in our current complex crises (climate change, pandemics-health, societal collapse etc). We will explore the OCTOPUS, which houses only 20% of its brain in the head (the rest distributed throughout its body), as a potential model for multi-mind thinking. And multi-mind thinking is what is required to enable self-organisation, wholeness and emergent evolution.
